

3d Brain Atlas Reconstructor

Software dedicated for automatic generation of models of 3D brain structures.

*Supported by an infrastructural grant
from the Polish Ministry of Regional Development
POIG.02.03.00-00-003/09*

1. Project goals

3. Application screenshots

Project goals

1. Creating software dedicated to automated reconstruction of 3D brain models. Key features:
 - ◆ Generating model of any combination of structures (ie. basing on structures hierarchy),
 - ◆ Arbitrary resolution of generated model (depends on source atlas quality only),
 - ◆ Exporting models as polygonal mesh or volumetric datasets.
 - ◆ Modularity: One 3D model generation module, many wrappers for different input atlases.
2. Support the software with:
 - ◆ Own data (ultimate goal),
 - ◆ Existing 2D atlases (as training sets).
3. Creating special dataset format
 - ◆ Based on SVG format,
 - ◆ Adapted for handling representation of brain structures,
 - ◆ Supporting brain regions hierarchy,
 - ◆ Maximizing possibilities of atlas systems interoperability.
4. Ultimately, 3D Brain Atlas Reconstructor would be available as an open source project and on-line service.

Application screenshots

Ontology tree (left) allows browsing for structures, select structures for reconstruction or load already reconstructed models. **Structure selection tab** (right) displays detailed information about currently reconstructed structure as well as provides reconstruction properties.

Model customization tab: Reconstructed structures may be previewed before exporting. Furthermore, additional model modifications (smoothing, mesh complexity reduction, etc.) may be applied.
